PRD: Quality First Turf — Customer Discovery & On-Site Quoting System

Client: Quality First Turf
Developer: Sarim
Platform: Web application
Primary Integration: Jobber

1. Objective

Build two connected web forms that allow customers to communicate their landscaping requirements and enable the salesperson to collect accurate on-site measurements. Data from both forms must be combined to identify the correct Jobber products and automatically populate a draft quote.

The priority is a smooth customer experience and a reliable quoting workflow with minimal duplicate data entry.

2. Scope of Work

Feature 1: Customer Discovery Form

Purpose: Let customers communicate what they want before an in-person consultation.

Requirements:

- Collect customer details: name, phone, email, and property address.
- Display all available service categories on one screen.
- Allow customers to select multiple services using checkboxes or visual cards.
- Display images for applicable service and product options.
- Use conditional logic to display only relevant follow-up questions.
- Capture installation types, product selections, approximate measurements, and applicable add-ons.
- Calculate square footage from length and width where applicable.
- Allow customers to continue when they do not know their measurements.
- Allow additional notes where specified.
- Do not display internal product pricing.
- Save each submission as a project record that can be retrieved by the salesperson.

Use the supplied `1st Form.pdf` and `form flow.docx` for the service categories, product options, add-ons, and conditional question logic.

Feature 2: On-Site Quote Form

Purpose: Allow the salesperson to confirm everything needed to prepare an accurate quote during the property visit.

Requirements:

- Provide a separate web-based form accessible through a dedicated URL.
- Make the form responsive and usable on mobile phones and tablets.
- Allow the salesperson to find and open the relevant customer submission.
- Prepopulate customer details, selected services, products, and add-ons from the discovery form.
- Allow the salesperson to confirm or update selected items.
- Support multiple work areas within one project.
- Capture measurements, dimensions, lengths, and quantities as applicable.
- Allow photographs to be uploaded and associated with the relevant work area.
- Allow the salesperson to add missing services, items, or notes.
- Save the completed on-site information against the same project.

The salesperson must not need to re-enter information already captured in the customer discovery form.

Feature 3: Jobber Integration & Quote Generation

Purpose: Combine the information from both forms to create a correctly populated draft quote in Jobber.

Requirements:

1. Save the customer discovery submission and associate it with a project.
2. Retrieve that project when the salesperson opens the on-site form.
3. Combine the customer's selections with the salesperson's confirmed measurements and quantities.
4. Match the combined information to the correct existing Jobber products using predefined mapping rules.
5. Include the appropriate products, quantities, and applicable add-ons in the draft quote.
6. Use Jobber's configured pricing rather than exposing or independently calculating customer-facing prices.
7. Allow the office team to review the draft quote in Jobber before sending it to the customer.
8. Flag missing product mappings or incomplete information rather than silently selecting an incorrect product.

9. Preserve form data and report integration errors if Jobber is unavailable.
10. Prevent duplicate quotes when a submission is retried.

Product selection may depend on customer type, service category, installation type, selected product, area range, measured quantity, and add-ons.

Technical dependency: Verify the required Jobber API operations before implementation. Confirm that existing catalogue products can be added to a draft quote with the required quantities and pricing. Report any API limitations before building around assumptions.

3. End-to-End User Flow

1. Customer opens the discovery form.
2. Customer enters contact details and property address.
3. Customer selects multiple services from one screen and sees relevant images.
4. The form presents conditional questions for the selected services.
5. Customer selects products, enters known measurements, and chooses applicable add-ons.
6. Customer submits the form, and the system saves the project.
7. The salesperson opens the on-site form and retrieves the original submission.
8. The salesperson confirms the services and adds detailed measurements, quantities, photos, and any missing items.
9. The system combines both submissions and maps the confirmed requirements to existing Jobber products.
10. A draft quote is populated in Jobber with the appropriate line items and quantities.
11. The office team reviews the draft before sending it to the customer.

4. Out of Scope

- Admin panel or self-service form configuration.
- Native iOS application.
- Site-plan generation through Neighborbrite or another AI/bot solution.
- Neighborbrite browser automation.
- Automatic sending or approval of quotes.
- Payment processing.

The separate on-site form must remain a responsive web form, not a native mobile app.

5. Acceptance Criteria

The implementation is complete when:

- Customers can select multiple service categories from one screen.

- Applicable options display images and relevant conditional questions.
- Customer submissions are saved and can be retrieved by the salesperson.
- The salesperson can confirm items, enter measurements and quantities, and upload photos from a mobile browser.
- Both forms are linked to the same project.
- The combined data maps to the correct existing Jobber products.
- A draft Jobber quote is populated with the correct line items and quantities.
- Jobber's configured pricing is applied correctly.
- The customer-facing form never reveals internal pricing.
- Missing mappings and integration failures are clearly reported.
- Retrying a submission does not create duplicate quotes.
- The office team can review the draft quote before sending it.

6. Implementation Order

1. Validate Jobber API capabilities for customers, products, and draft quotes.
2. Define the project data structure and product-mapping rules.
3. Build the customer discovery form and conditional logic.
4. Build the responsive on-site quote form.
5. Integrate both forms with Jobber and implement draft quote generation.
6. Test multiple services, product combinations, measurement ranges, add-ons, missing mappings, and retry scenarios.

Definition of success: The customer explains what they want, the salesperson confirms what is required on-site, and Jobber receives a correctly populated draft quote without the office rebuilding the quote manually.
